## IT Security Consulting

The business processes of a company are based increasingly on complex IT systems and applications, with the consequence that IT security is also becoming more and more important. For both users and designers of IT products there is a growing need for competent consulting in this field. However, as security-related topics are frequently not taken into consideration until damage has already taken place, or as a direct reaction to legal regulations, there is at times a considerable risk potential that is either underestimated or not recognised in time. Only with the right planning and the implementation of suitable IT security measures can you be sure of having optimum protection. Efficiency and economic viability make balanced risk control possible.

### Your security is our goal

The threats arising from the use of IT systems must be identified and the associated risks minimised. We provide comprehensive consulting services to this end. We focus on the performance of security analyses and the development of customer-specific security concepts and security management processes. In addition, we also take over the development and integration of security solutions and their safe operation. In doing so, we observe security standards customary in the market to safeguard the quality and interoperability of your IT systems.

### Key benefits

- The confidentiality of your sensitive data is preserved
- The integrity of your data and applications is safeguarded
- The authenticity of the users, your data or services is guaranteed
- Your IT-based business processes are made understandable and binding
- You data are protected against loss and non-availability

### Our services

#### ■ Creation of IT security concepts and security policies

Security conception includes above all the definition of security management processes, describing the realisation and maintenance of the security standards established in a company and determined in a security policy. On the basis of the security policy we and our clients jointly develop detailed procedures and guidelines extending to the security-relevant sections of operating manuals.
