NetLine/Crew Fatigue Risk Management

What NetLine/Crew Fatigue Risk Management is all about:

NetLine/Crew Fatigue Risk Management (FRM) provides the integration of fatigue evaluation into the complete process of crew scheduling (in the planning phase as well as on the day of operation). It allows you the consideration of fatigue issues in time. The usage of FRM may allow you to fly under own developed flight time limitation schemes. The NetLine/Crew Fatigue Risk Management is based on the scientific algorithm SAFE from FRMSc. It gives graphical information of fatigue levels and generates warnings and alerts if a crew member's schedule is violating defined fatigue levels.

- Considers scientific based Fatigue Risk Algorithms (SAFE from Fatigue Risk Management Science Limited)
- Fully integration of fatigue and alertness information into the crew scheduling process
- May allow the implementation of own developed flight time limitation schemes
- Meets the recommendation from EASA and FAA
